

ADVANCED FRÉCHET INCEPTION DISTANCE

[Your report title]

[Your name] / [Student ID]

[Submission date]

Optional starter, not a completed submission. Replace all prompts, empty cells and example objects. Submit at most six pages plus references, together with a separate archive that scores the bench from a seed. This title block is part of the report, not an extra cover page. The **assessment brief** governs the task; the **policies page** governs reporting and tool disclosure. Delete this guidance paragraph before submission.

Part A. The proposal [25 points]

Writing prompt: State what a paper should report in place of FID and which failure it addresses. Define the proposal precisely enough to implement and evaluate it. For an existing method, cite its source and identify your contribution.

Definition and intended use

Writing prompt: Name the inputs, parameters, output, units and direction of improvement. Say which comparisons are meaningful. Replace the equation placeholder below.

$$\hat{Q}_\theta(\mathcal{X}_R, \mathcal{X}_G) = [\text{define your proposed metric here}]. \quad (1)$$

Writing prompt: Explain each symbol in Equation 1. A reporting protocol may need a precise procedure rather than a single scalar equation.

Part B. The evaluation [45 points]

Writing prompt: Evaluate the proposal against the course's standard. Address each of the four questions below, or justify its absence. An empty subsection is not a justification. Keep measured evidence separate from proposed experiments.

Measurement protocol

Setting	Your specification
Reference and candidates	[Bench R; candidates A, B and C; construction]
Sample counts	$[N_R, N_G]$, and the sample-size ladder for extrapolation]
Implementation	[Code version, estimator, precision and dependencies]
Representation	[Feature map; preprocessing, or why it is not applicable]
Randomness	[Seeds, repetitions, and fixed versus redrawn reference]
Extrapolation	[Fit, range, residual checks and sensitivity for FID_∞]

Bench comparison

Writing prompt: Score A, B and C under the proposal beside FID and FID_∞ . Identify the protocol for each row. Empty cells below are placeholders, not zero scores. Explain the direction and units of your proposed score; its scale need not be comparable to FID's.

Candidate	Protocol	FID	FID_∞	Proposed Q
A	—	—	—	—
B	—	—	—	—
C	—	—	—	—

Estimator bias / Week 5

Writing prompt: How does the estimate change with sample size? Separate sampling variation from bias. State what the measurements support and what remains unknown; justify any missing evaluation.

Blind spots / Week 6

Writing prompt: Describe a construction that challenges your proposal. Distinguish a failure of the estimator from a limitation of the quantity it estimates. Explain what happens to C , without assuming that a new metric must detect it.

Correlation with human judgement / Week 10

Writing prompt: Evaluate the evidence for agreement with people. A synthetic bench is not a human study. If you did not run a study, justify that absence and specify what evidence would be needed instead; do not invent human ratings.

Cost of adoption / Week 11

Writing prompt: What would a paper pay in computation, data, human effort and lost comparability to adopt the proposal? State the assumptions behind the account.

[Replace with your diagnostic figure]
No measurements are supplied by this placeholder.

Figure 1: [Explain the claim this figure tests, the protocol and uncertainty. State what the reader can and cannot conclude.]

Part C. Where it fails [30 points]

Writing prompt: Name the condition under which you would still report FID. State how badly the proposal fails and which of the four evaluation criteria exposes that failure. If your answer is “never”, revisit Part B.

The boundary of the claim

Writing prompt: State the strongest claim your evidence supports, then name a claim it does not support. Explain the practical consequence of that distinction.

Reproducing this report

Writing prompt: Point to the separate archive: entry command, seed, environment, expected outputs and the files behind your tables and figures. Follow the linked policies for reporting and any tool-use disclosure; this template does not create a second set of course rules.

References

Writing prompt: Replace this prompt with the sources actually used. Cite them where their ideas enter the report. No references or results have been fabricated for this starter. You may use BibTeX, biblatex, or the manual example below.
